## Introduction

---

The City of Portsmouth hired Baden Consulting Services, LLC (BCS) to perform an update to the City's pavement management system. This project is part of an on-going program where a portion of the City's road conditions are evaluated annually, the road network conditions and budget requirements are analyzed, and road paving programs are developed.

In the Fall of 2024, BCS resurveyed the pavement condition of 37 miles of Portsmouth's total 104-mile, City-maintained road network. By hiring BCS to resurvey a portion of the City's roads each year and updating the roads where maintenance and resurfacing has been performed, Portsmouth has maintained an up-to-date Pavement Management System.

Under the scope of this project, BCS performed a detailed inspection of the condition of the pavement on the City maintained roads and has created a database of this information that can be viewed, edited, and analyzed using pavement management software. BCS will deliver this database to staff in the Public Works Department. The data will also be displayed on a custom web dashboard which will allow the City to view, map, and query road conditions and repair estimates.

This report describes the steps taken in this project, the results of the field evaluations, and compares the results of potential roadway funding scenarios.

# Theory of Pavement Management

Pavement management is the practice of planning for pavement resurfacing, repairs, and maintenance with the goal of maximizing the value and life of a pavement network. To accomplish this, a community needs to have several repair techniques in its arsenal and the knowledge of when to apply them. This is where pavement management comes into play. With a comprehensive database of road conditions, the pavement management software can model when to perform which repairs on a road network. Of course, engineering judgment is required to finalize any list of street repairs, as no computer model can take every variable analyzed in making a repair decision into account.

## The Pavement Deterioration Curve

Below is a model of how a street's pavement deteriorates over time. Interpreting the curve, a street starts out in excellent condition when it is newly constructed. Midway through its life, a lower cost repair such as surface treatment would maintain the road and cost approximately \$5.00 per square yard. It takes only a few years for the window of opportunity to perform this low-cost maintenance to pass after which the road would need an overlay or a mill and overlay costing \$15-\$25 per square yard. By performing timely maintenance, road conditions can be improved today thereby extending the life of the road. The unit costs shown below are typical ballpark costs. Portsmouth's current unit costs are shown in Appendix C.

**PAVEMENT DETERIORATION VS COST (TYPICAL)**

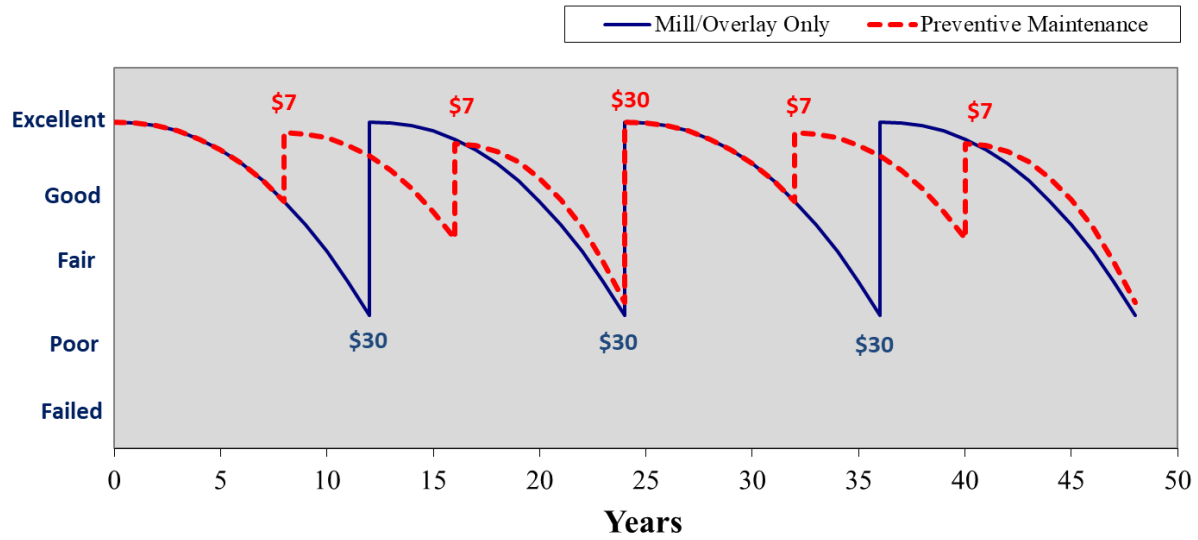

In addition to the price points shown on the preceding graphic, there are multiple treatment types that are appropriate at each stage in the pavement's deterioration. Beginning from when the pavement is new, down to when the pavement has failed, most roads progress through stages where each of the following treatment types would be appropriate.

- Do Nothing
- Crack Seal
- Surface Treatment
- Asphalt Overlay
- Mill and Overlay
- Local Full Depth Patch, Mill, and Overlay
- Reclaim and Pave
- Full Depth Reconstruction

The benefits of preventive maintenance can be best demonstrated by comparing the life-cycle of a road using preventive maintenance versus using traditional methods. In the following chart, the blue line represents the City's current approach of milling and overlaying its collector roadways approximately every 12 years. The red line represents an approach of applying a surface treatment at 8-year intervals between mill and overlays. There are a few different types of surface treatment which could be selected by the City specifically for each project, but generally, surface treatments are an application of an asphaltic material, aggregate, and additives that are applied to the full roads surface between 3/8" and 3/4" thick, such as slurry seals, chip seals, or microsurfacing.

## PREVENTIVE MAINTENANCE VS MILL/OVERLAY ONLY

The dollar amounts shown in the above chart are \$7 per square yard for a surface treatment/preventive maintenance, and \$30 per square yard for a Mill and Overlay project as typically performed in Portsmouth which typically includes some cost for drainage and/or sidewalk repairs. The chart shows that in the 48-year span demonstrated, using preventive maintenance would cost an aggregate of \$58/SY vs \$90/SY without maintenance. A saving of \$32/SY or 35%. That adds up to a saving of \$650,000 per mile and over \$26,700,000 for the 41 miles of Arterial and Collector roads in Portsmouth. It should be noted that high volume and downtown roads come with significant constructability constraints and not all treatment types will be feasible for every situation.

---

# 2

## Methodology

---

The City developed its pavement management system over 25 years ago, and thus, many of the following steps have been previously completed. However, the steps are revisited and updated as appropriate during the annual system update. As all these steps are relevant to understanding the basis of the analysis currently presented, they are described here.

### **Network Identification**

Network Identification builds an inventory of streets that describe the municipality's complete roadway network. The direction of travel, street length, width, one-way status, ownership, functional classification, zone, and pavement type are among the items identified at this initial phase in the pavement management process. This integral step ensures the streets surveyed are the definitive set to be analyzed.

### **Pavement Management Section Identification**

Each street contains one or more pavement management sections. A pavement management section defines the limits of previous construction or maintenance activities within each street. Sections are defined by having the same width, typical distresses, functional class, etc. The goal

is to set up homogenous areas of pavement to aid in assigning the appropriate repair. A street may be one section, or it may be comprised of several pavement management sections, depending on its construction history.

## Surface Distress Assessment

For each pavement management section, the severity and extent of nine major pavement distresses are recorded and then entered into a weighted formula to arrive at a Pavement Condition Index (PCI). The distresses are categorized as base related or surface related distresses. Base related distresses indicate that the pavement structure is inadequate for the existing traffic load and soil conditions. Streets that show significant base related distresses may need to have the pavement structure strengthened with either thicker or stronger base or pavement materials. Surface related distresses are caused by age and weathering of the pavement. Streets that have predominantly surface related distresses are excellent candidates for maintenance sealing to inhibit further pavement oxidization (the main effect of aging). Streets with more of the base related distresses will most likely need some full depth patching, structural overlays, or reclamation/reconstruction.

### The four base related stresses are:

---

- Potholes
- Alligator cracking
- Distortion
- Rutting

### The five surface related distresses are:

---

- Block Cracking
- Transverse and Longitudinal Cracking
- Bleeding or Polished Aggregate
- Surface Wear or Raveling
- Corrugations, Shoving, or Slippage

## PCI Defined

A PCI was generated for each inventoried pavement management section in Portsmouth using the surface distress. PCI is measured on a scale of zero to one hundred, with one hundred representing a pavement in perfect condition and zero describing a road in impassable condition. Each type of observed pavement distress is assigned a deduct value based on the type, severity, and extent of the distress.

A weighted sum of the deduct points is subtracted from the perfect “one hundred” road in order to generate a PCI for each pavement management section. In general, base related (pavement foundation) distresses are weighted more heavily than surface related distresses.

**PCI Is Calculated as:**

$$PCI = 100 - (\text{Highest Deduct Value}) - (25\% \text{ of remaining base related deduct values}) - (10\% \text{ of remaining surface related deduct values})$$

## The Five Treatment Bands

The pavement management system uses broad ranges to group the individual repair types into five major treatment bands. Treatment bands are a useful tool to summarize data on a Town-wide basis. An individual road segment will fall into a particular category based on the strategy table’s output of repair types and will vary due to functional classification.

### TREATMENT BAND DESCRIPTIONS

Treatment Band	PCI	Description
Do Nothing	93-100	Excellent condition - in need of no maintenance
Routine Maintenance	86-92	92 Good condition – may be in need of crack sealing or minor localized repair
Preventive Maintenance	72-85	Fair condition – pavement surface may be in need of surface treatment, full depth patch and/or crack sealing
Structural Improvement	61-71	Deficient condition – pavement surface structure in need of added strength for existing traffic. Typical repairs are overlay with or without milling or levelling
Base Rehabilitation	0-60	Poor condition – in need of base improvement. Typical repairs are reclamation or full depth reconstruction

\* These are general PCI ranges for reference purposes and represent only one pavement type. There are several factors considered by the system when assigning repair types to each individual street.

### **Do Nothing**

The Do Nothing category exhibits roads which are in need of no maintenance. These roads are in excellent condition and existing distresses generally do not need to be addressed.

### **Routine Maintenance**

Routine maintenance activities are those which are taken to correct a specific pavement distress. Routine maintenance usually addresses localized pavement defects and includes activities such as:

- Full depth patching;
- Skin patching;
- Crack sealing.

### **Preventive Maintenance**

Preventive maintenance activities are those which are performed at planned intervals to protect and seal the pavement. Seals are designed to provide one or more of the following benefits:

- Prevent the intrusion of air and moisture;
- Fill small cracks and voids;
- Rejuvenate an oxidized binder;
- Provide a new wearing surface.

### **Structural Improvement**

Structural improvement includes the work necessary to restore the pavement to a condition that will allow it to perform satisfactorily for several years. Generally, a structural improvement will consist of a milling the existing pavement down and applying a new Hot Mix Asphalt Overlay allowing existing grades to be maintained. When the existing grade can be increased a new Hot Mix Asphalt course can simply be placed upon the existing surface. Structural improvements also include the work necessary to prepare the pavement for an overlay, either with or without milling. The major activities involved in the rehabilitation process are:

- Partial depth patching;
- Full depth patching;
- Joint and crack sealing;
- Grinding and milling ;

- Hot Mix Asphalt Leveling Courses.

### **Base Rehabilitation**

Base rehabilitation typically utilizes one of two methods:

- Reclamation; with or without fortifying the base with aggregate or additives
- Reconstruction.

Reclamation is the process of rehabilitating existing deteriorated pavements. The existing pavement and base, subbase, and possibly subgrade are pulverized and blended to create a homogenous pavement base. This reclaimed pavement base is then paved with a new Hot Mix Asphalt surface. Reconstruction is the complete removal and replacement of a failed pavement, and might also involve widening, realignment, traffic control devices, safety hardware, and major base and drainage work.

## **Customizing Repair Strategies and Costs**

Through the maintenance of the City's pavement management system, a standard pavement maintenance and rehabilitation strategy has been developed to assist in the automated generation of project candidates and budget analysis. During this update, the strategy was not modified, however the unit costs of repair alternatives was updated to match current construction pricing.

## **Preparing Budget Scenarios**

Once the roadway conditions are inventoried and analyzed, and the repair strategies are defined, the impact of various spending programs on the road network can be assessed. These studies can range from 1 to 20 years, however, for this report, 5-year studies are used. The purpose of the budget planning process is to determine the impact of various spending levels to find a funding level that will best meet Portsmouth's needs. Deterioration curves, unit costs, and the strategy table developed in the repair strategy definition phase are used to assign each street a repair type and associated cost for each year of the study. Each street is also assigned a benefit value that is used to determine which streets the software assumes will be repaired each year. It is important to understand that this study is a network-wide planning tool. Field verification and testing are recommended to confirm any street repair list generated.

Pavement management deals with the life cycle of pavement structure and the various repair treatments to maintain the condition of the pavement. The pavement management system and the various repair types utilized in the study do not directly address other physical improvements associated with a roadway. Some of the items, which might be encountered on a roadway project, include the storm drainage system, traffic signals, minor traffic items, sidewalks, and utility adjustments. In an attempt to develop a reasonable cost of various improvements, the overall scope of a typical project associated with the various repair types was estimated to develop a network-level unit cost for the work. The actual scope of work and costs will vary for each individual roadway. Actual repair costs will need to be developed at the project level and may differ from the costs utilized in this study.

## **Deterioration Curves**

In order to properly plan for future repairs, the budget analysis feature of the pavement management system uses deterioration curves. The deterioration curves estimate the rate at which the pavement condition decreases over time. In the pavement management system, each pavement segment can be assigned a custom curve, however, as is more common, families of curves are developed for roads of common pavement type and functional class.

## **Strategy Table**

A table of repair strategies is used to assign specific road repair types to individual roadway segments. The repair strategy table incorporates PCI ranges as well as functional class and pavement type to simulate decisions consistent with Portsmouth repair practice and procedure. The strategy table was customized for Portsmouth to recommend the types of repairs that the City has found to be best suited to Portsmouth's roadway network.

## **Project Prioritization**

The budget analysis software prioritizes needed system repairs based on a calculated project "Benefit Value". The Benefit Value is calculated using variables representing traffic volume, repair service life, PCI, and unit repair costs for each pavement management section. For each plan year, the software prepares a future roadway condition projection, exhausts the assigned budget, and then produces an annual list of roads included in the repair program. The Benefit Value prioritization process generally favors cost effective maintenance alternatives. Repair actions are typically delayed on those sections that require reconstruction or major

rehabilitation because the benefits for dollars spent are generally lower than maintenance candidates. After the relatively good roads are "saved", improvements are directed towards the poorer arterial and collector roads, and then to the local roads in need of major rehabilitation.

**The Benefit Value is calculated as:**

$$\textit{Benefit Value} = \frac{\textit{ADT} * \textit{Life of Repair}}{\textit{PCI} * \textit{Unit Cost of Repair}}$$

In the case of Portsmouth, the funding levels input into the analysis are often earmarked for either Capital or Maintenance type projects to control the ratio of project type selection, thereby somewhat overriding the Benefit Value in order to address more roads in poor condition.

---

# 3

## *Existing Conditions*

---

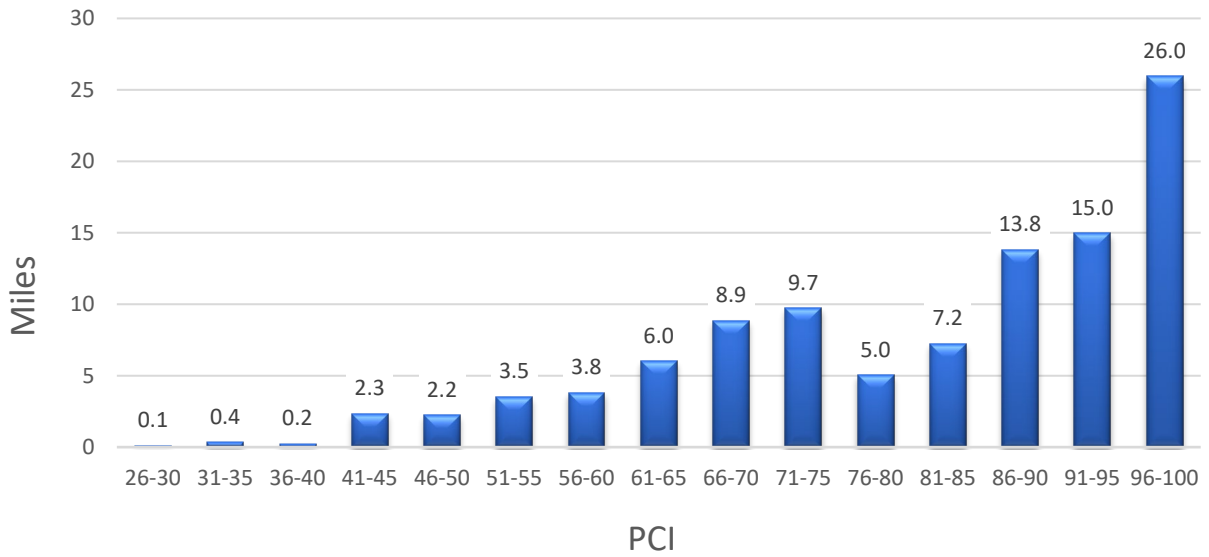

### ***City-maintained Streets Pavement Conditions***

In the Fall of 2024, Baden Consulting reevaluated the pavement condition of 37 miles of Portsmouth's total 104-mile City-maintained road network. By having a minimum of 25% of the road network re-evaluated each year and updating the roads where maintenance and resurfacing has been performed, Portsmouth has maintained an up-to-date Pavement Management System. Currently, Portsmouth has all major roads evaluated every other year, and local roads evaluated every four years.

**The projected average Pavement Condition Index (PCI) for Portsmouth roads is an 82**, which is a single point increase over the 81 that had been consistent since 2021. The average PCI is considered "projected" because the calculation of an average PCI involves the use of deterioration curves to project today's PCI for roads that were not surveyed or repaired this year.

The following chart shows a detailed breakdown of the projected condition of Portsmouth's roads by summing the number of miles of roadway into bands of 5 PCI points.

### PCI DISTRIBUTION

The large number of road miles in the highest PCI bands is a testament to the investment and effort the City puts into the road network. It also suggests that quality control measures are being taken to ensure that lasting road surfaces are being installed.

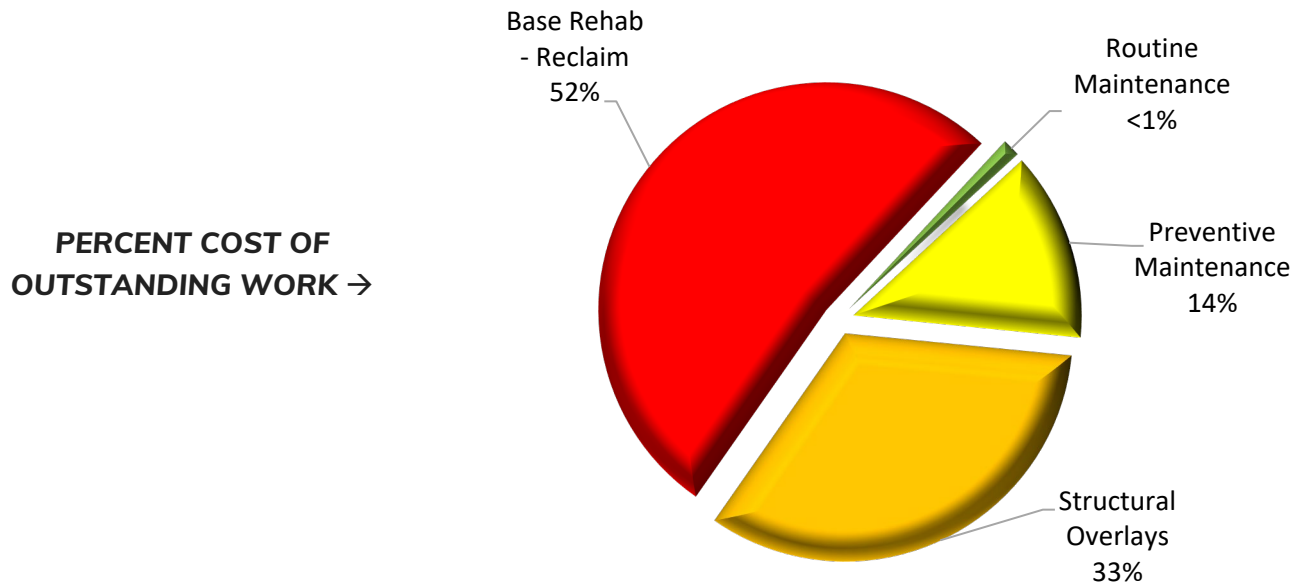

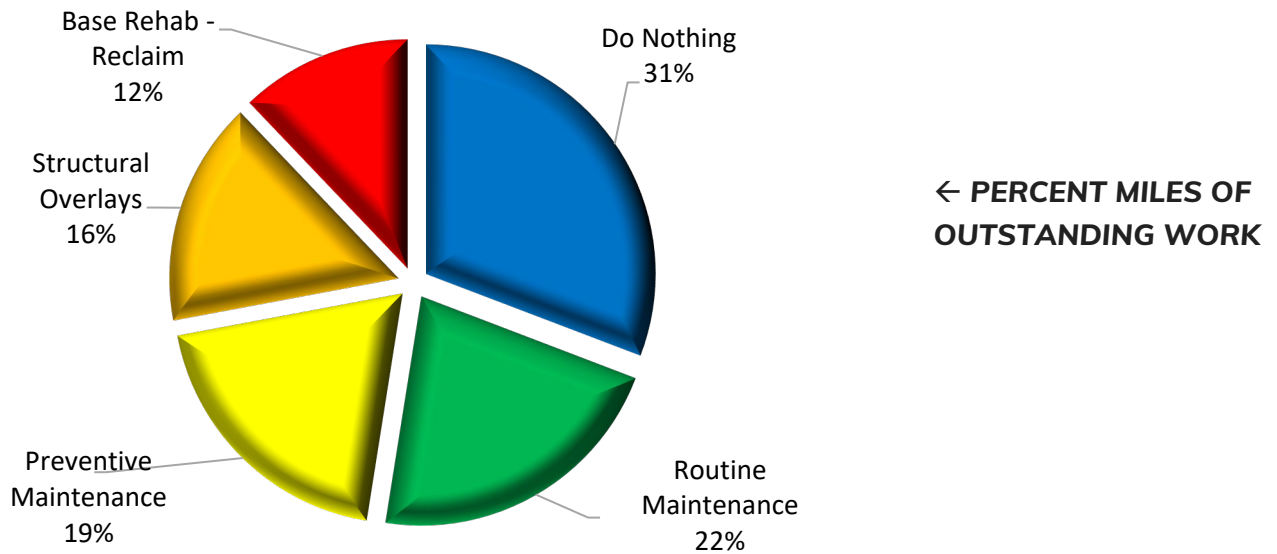

## Backlog of Work

Applying the five treatment bands shown in Table 1 and the unit costs shown in Appendix C to Portsmouth’s street network, the following table gives the miles and dollars associated with each treatment band for the conditions at the time of the analysis. Placement of a road into a treatment band is not based solely on PCI, the base index and curb reveal are also factors that come into play when determining the appropriate treatment.

### PAVEMENT BACKLOG SUMMARY

Treatment Band	Miles	Dollar Backlog
Do Nothing	32.1	\$0
Routine Maintenance	22.6	\$239,000
Preventive Maintenance	20.4	\$2,536,000
Structural Improvement	16.5	\$6,303,000
Base Rehabilitation	12.6	\$9,931,000
<b>Totals:</b>	<b>104.3</b>	<b>\$19,009,000</b>

The following two figures present the preceding information graphically.

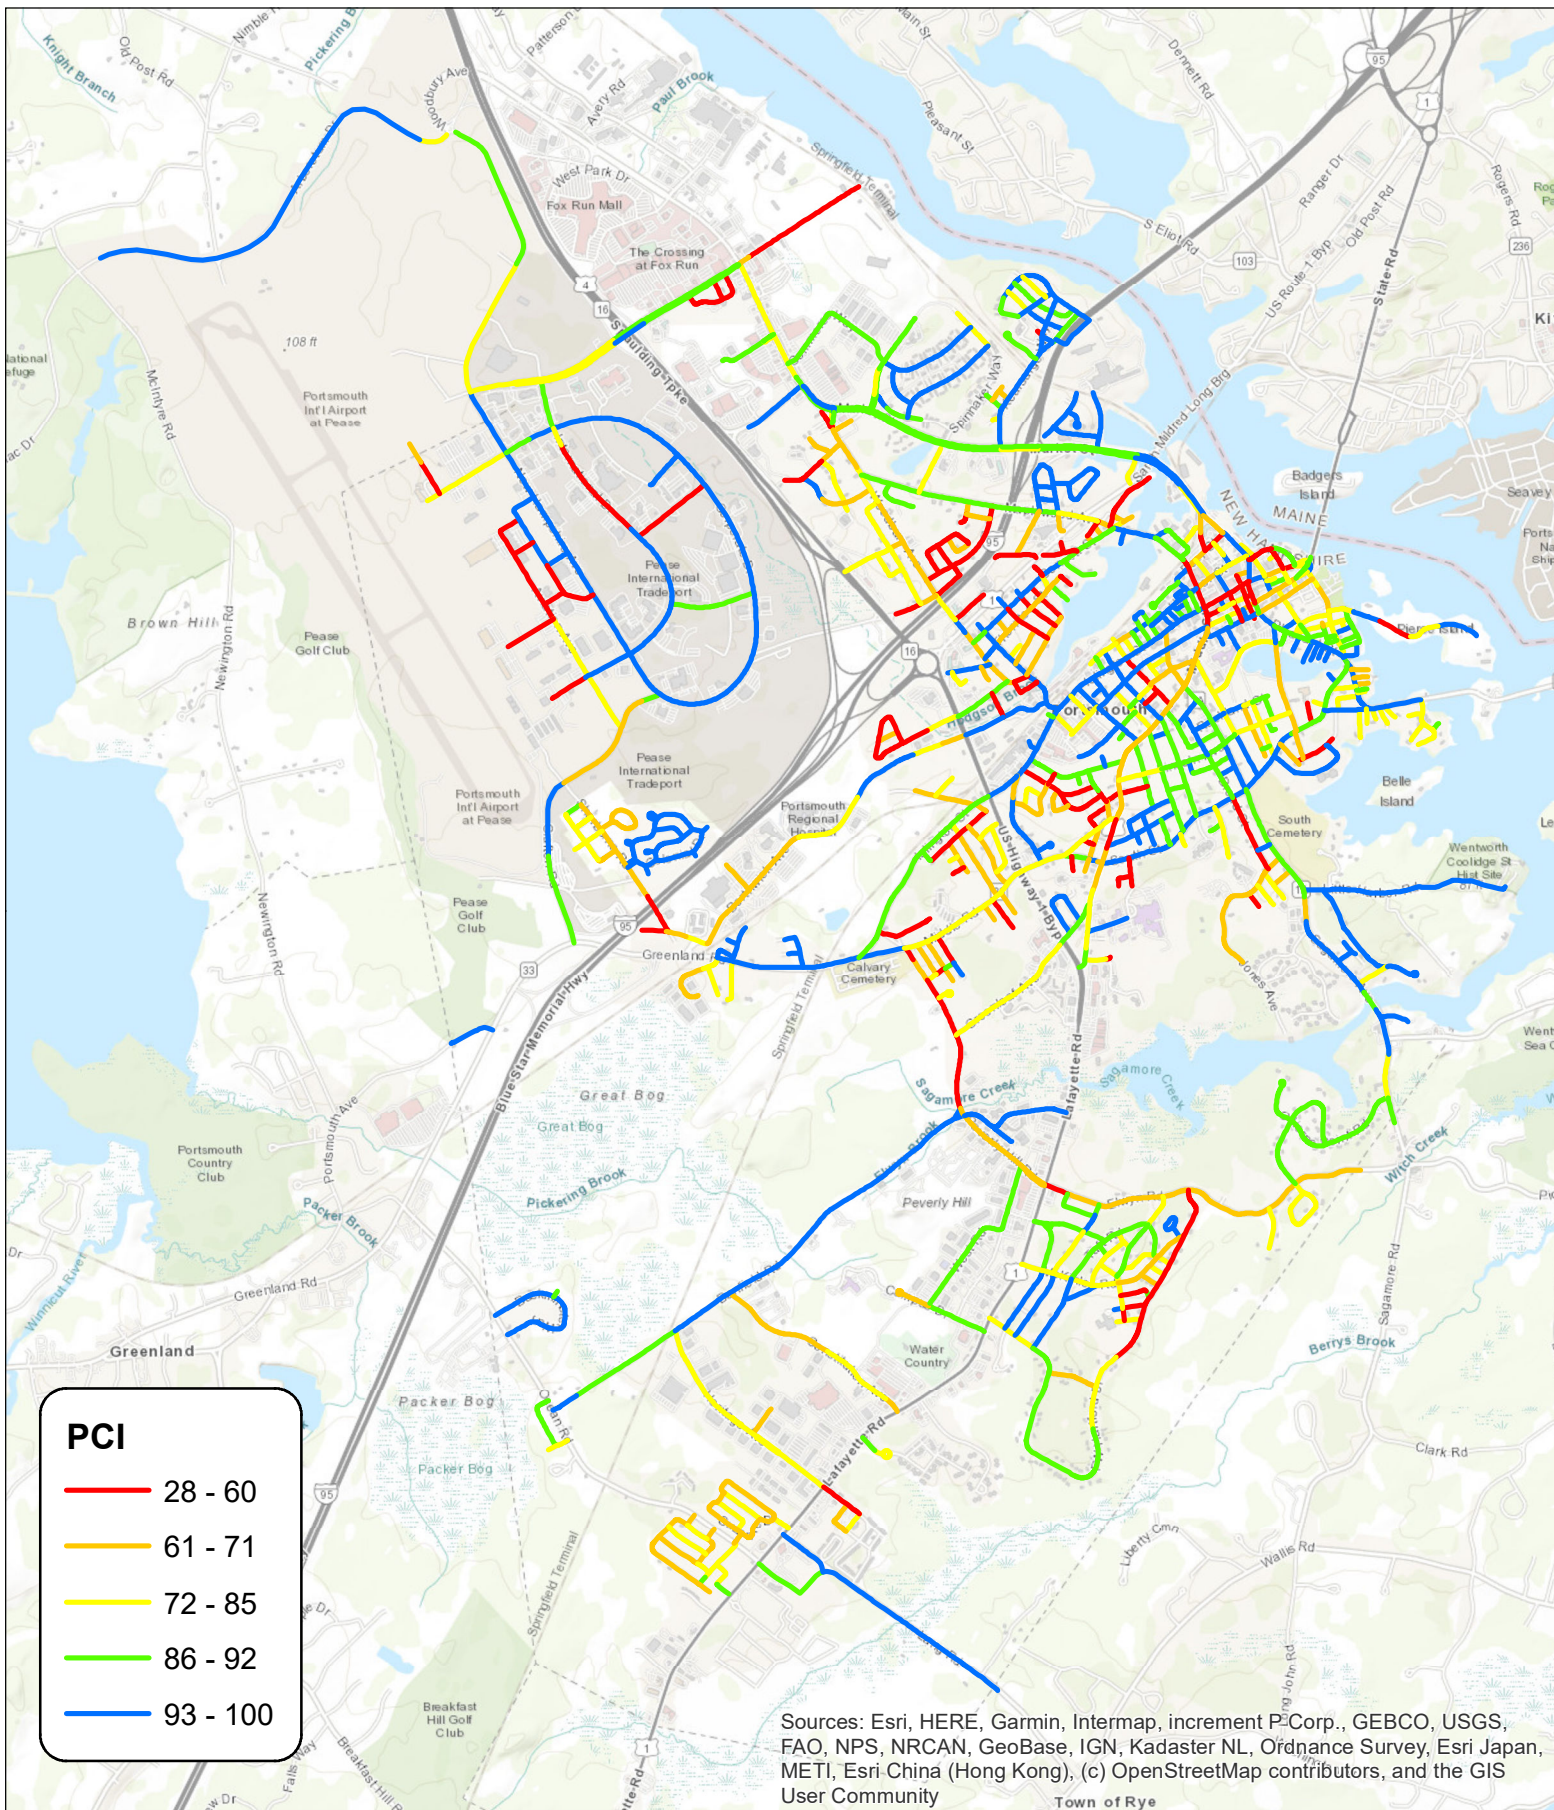

Figures 3 and 4 demonstrate that while only approximately 28% of the City's roads are in need of Base Rehabilitation or Structural Overlay level of repair, they account for 85% of the outstanding backlog of work, emphasizing the importance of maintaining the roads in good/fair condition to keep them from deteriorating and further increasing the backlog of work and the budget required to maintain it.

## **Conditions Mapped**

By linking the City's pavement database to a GIS roadway centerline, the City has the ability to create maps to assist in the analysis and presentation of the information within the database. The City can easily map current and projected pavement conditions based on numerous potential funding scenarios and create plans for single or multi-year road programs. The map on the following page which displays the current pavement condition is one example of the type of mapping possible.

# Pavement Condition Index Map (November 2024)

---

# 4

## Pease vs. Non-Pease Comparison

---

The estimated average PCI for roads in the Pease district is an 84, a considerable improvement over the 77 reported last year. The estimated average PCI for roads in the rest of the City is an 81.

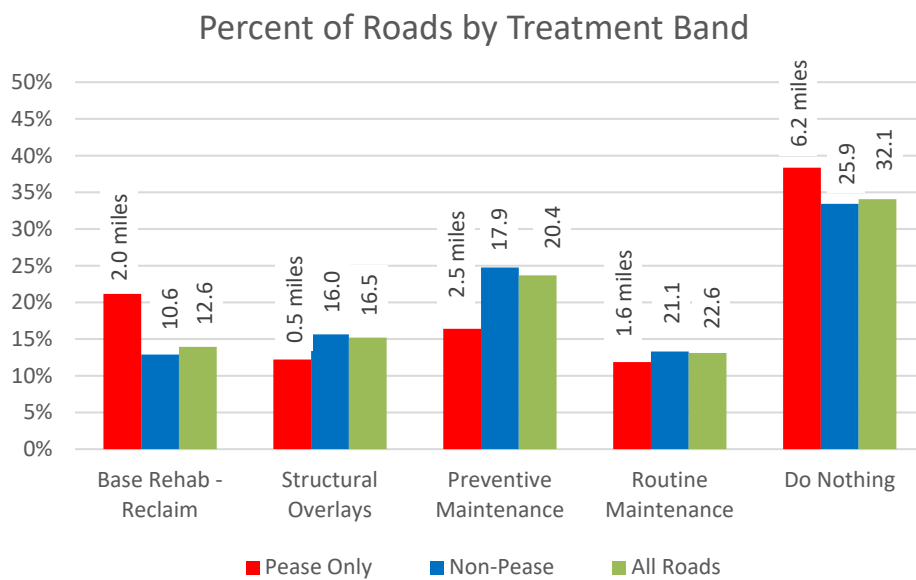

The following table summarizes the backlog of work in Pease vs. Non-Pease streets

Treatment Band	Miles		Dollar Backlog	
	Pease	Non-Pease	Pease	Non-Pease
Do Nothing	6.2	25.9	\$0	\$0
Routine Maintenance	1.6	21.1	\$21,000	\$219,000
Preventive Maintenance	2.5	17.9	\$378,000	\$2,159,000
Structural Improvement	0.5	16.0	\$155,000	\$6,148,000
Base Rehabilitation	2.0	10.6	\$1,979,000	\$7,952,000
<b>Totals:</b>	<b>12.8</b>	<b>91.5</b>	<b>\$2,533,000</b>	<b>\$16,478,000</b>

The following chart compares the percentage of road miles in the Pease/Non-Pease/Citywide areas in each of the five treatment bands. The percentages were determined using the total mileage for each respective area.

The chart bar lengths represent percentage, the labels indicate actual mileage.

### PEASE VS NON-PEASE BACKLOG COMPARISON

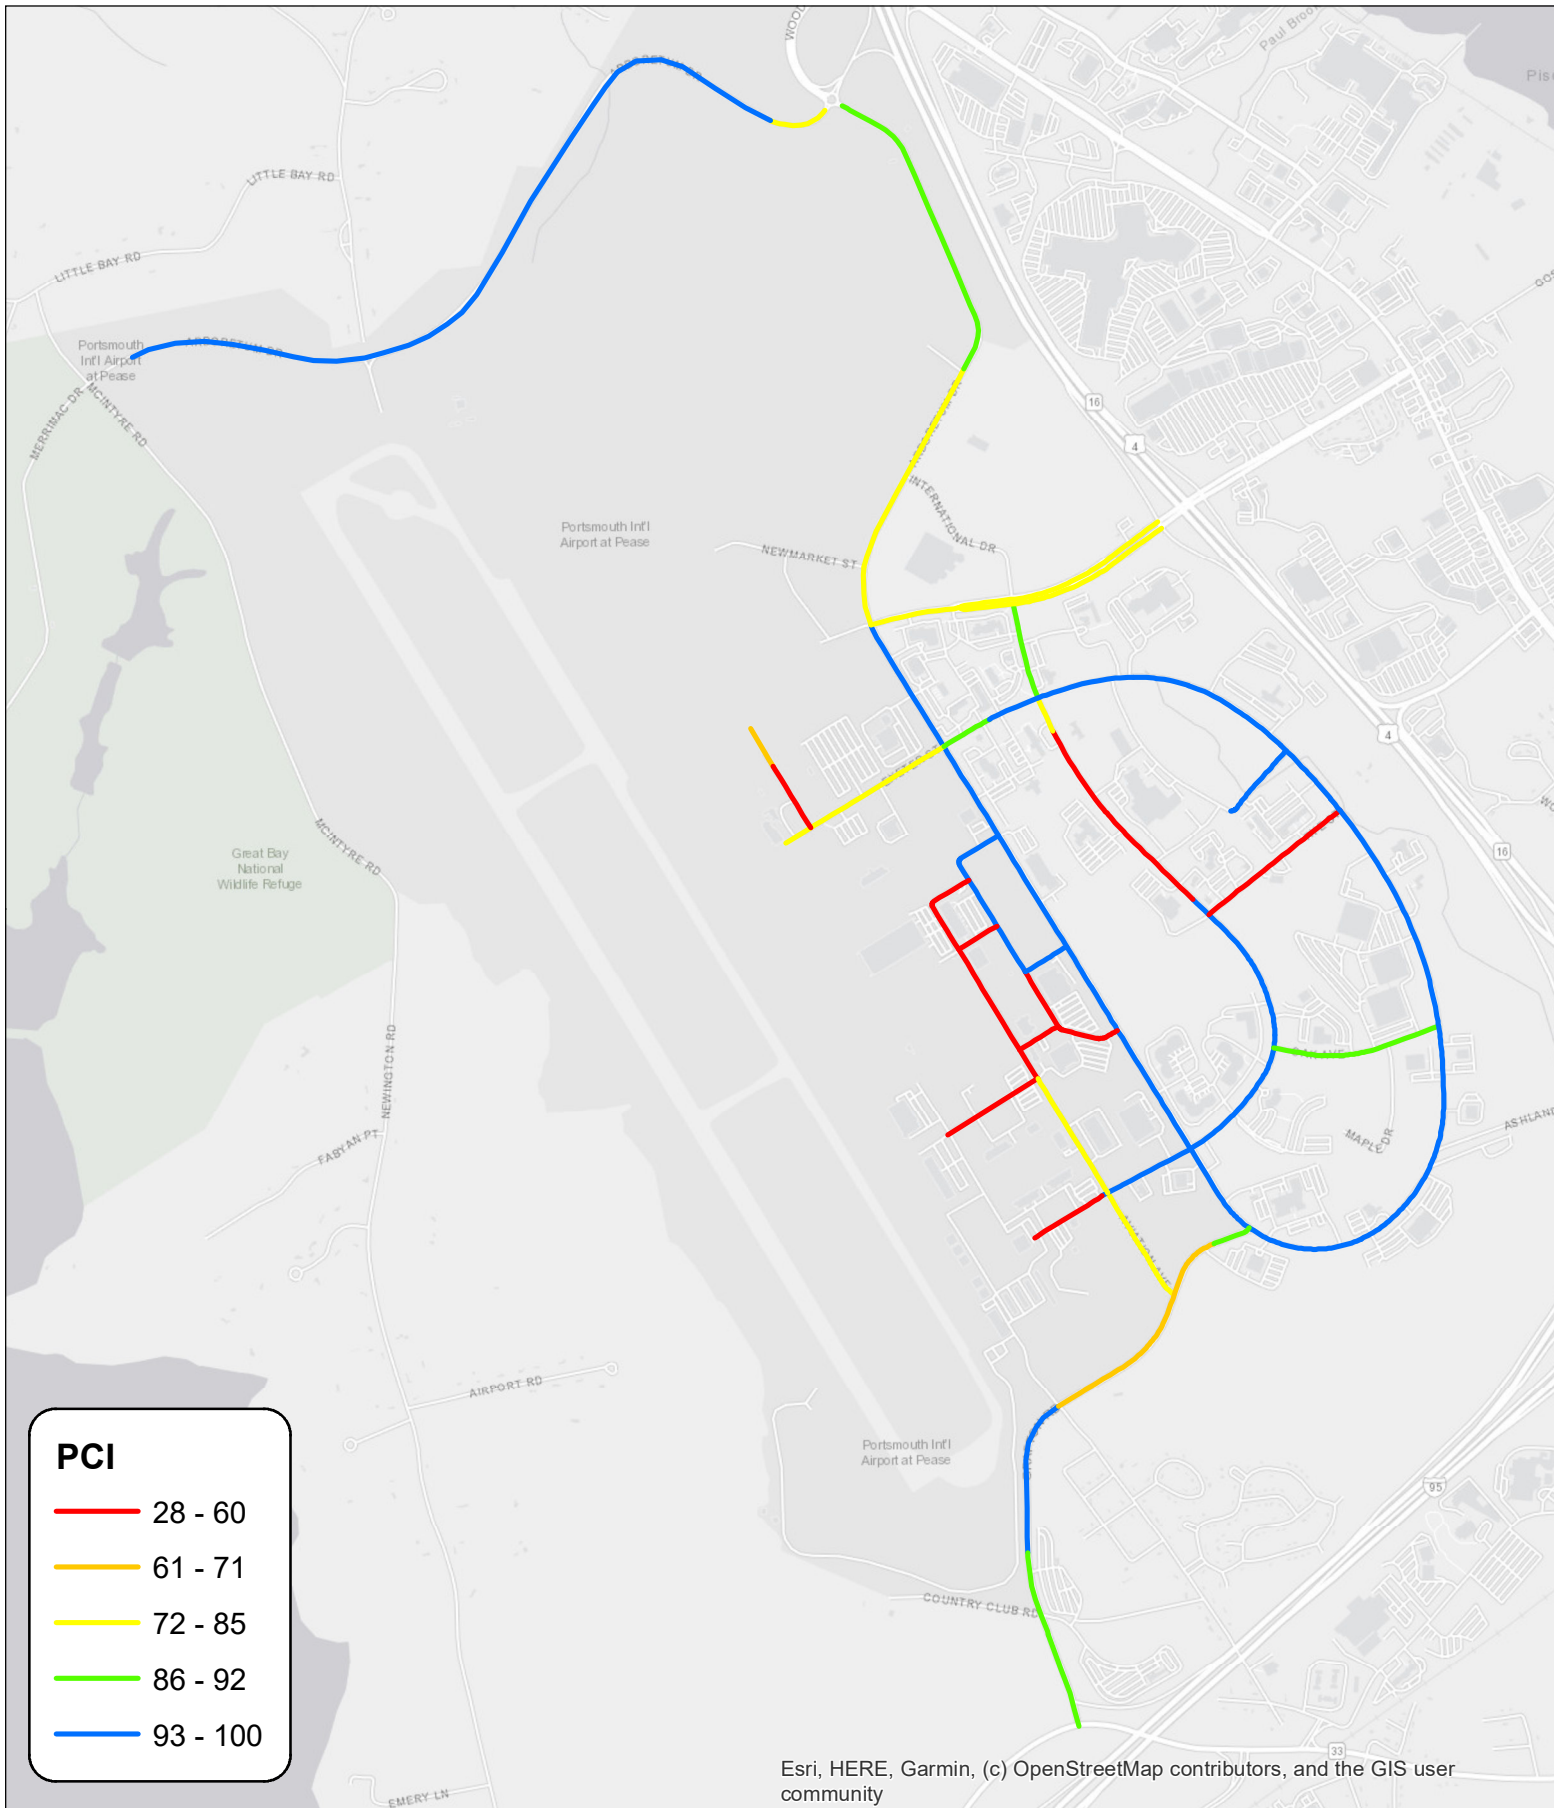

Thanks to recent improvements in the Pease area, it now has a moderately higher average PCI than the rest of the City. The distribution of conditions between Pease and non-Pease area roads is similar, with the Pease area mildly focused more toward the extremes of excellent and poor conditions.

The following page contains a map of the Pavement Condition Index on Pease area roads.

# Pavement Condition Index Map (Pease Area: November 2024)

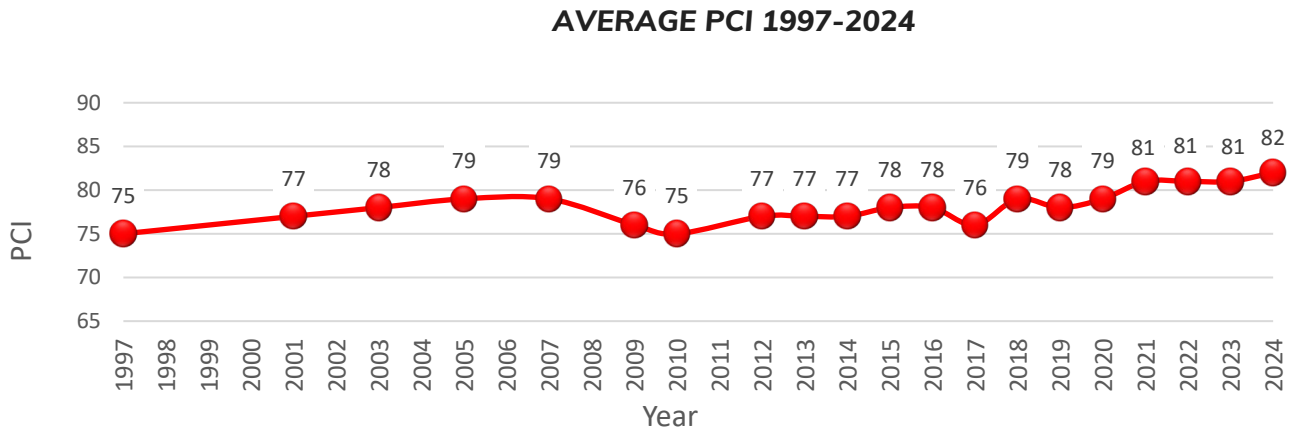

# 5

## PCI Trend

As the pavement management system has been updated over the years, the city-wide average PCI has been tracked.

The following chart shows the trend in City-wide estimated average PCI since 1997.

While there was a drop in conditions post-2008 when no pavement maintenance or rehabilitation was performed, the City has generally maintained and improved the road network consistently for the past 20+ years.

---

# 6

## *Budget Analysis*

---

The pavement management system is able to predict the effects that given funding levels will have on the road network. The most common points of analysis for budget analysis are the year-by-year projected town-wide average PCI, and the year-by-year projected dollar backlog of work. The results of some specified funding levels are presented in the section below, to look at the predicted effects of the current funding level, with and without preventive maintenance treatments being used, as well as the funding levels needed to achieve specific network goals.

### **Scenarios Explored**

BCS projected the PCI and backlog for four 5-year scenarios. The first three scenarios include \$2M of capital work, complemented by varying funding levels for pavement maintenance activities. BCS also explored the funding required to maintain overall conditions and curtail the growth of the outstanding backlog of work.

- \$2,000,000 Capital Paving Only (Per Year for 5 Years)
- \$2,000,000 Capital + \$150,000 Maintenance (Per Year for 5 Years)
- \$2,000,000 Capital + \$300,000 Maintenance (Per Year for 5 Years)
- \$2,700,000 Capital + \$300,000 Maintenance (Per Year for 5 Years)

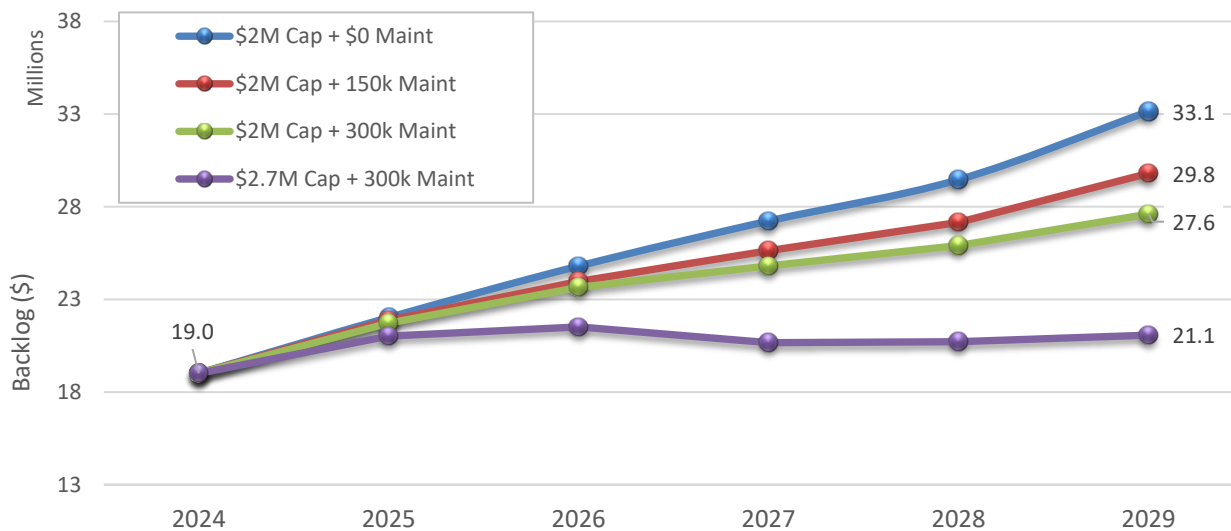

# Summary of Scenario Results

The effects of the budget scenarios are most easily understood when charted. The following charts show the trend in overall conditions, and in dollar backlog for all of the scenarios explored:

### PROJECTED AVERAGE PCI

### PROJECTED BACKLOG

The projected average PCI chart shows that it would cost approximately \$3 million per year to maintain the current average PCI. This is a significant increase, as a year ago it was reported that \$2.3 million per year would maintain the average. In addition to a small increase of three tenths of a mile in the road network being included in the study, the primary reason for the change in projections is the considerable increase in construction costs. Across the spectrum of pavement maintenance and rehabilitations options, the City's costs increased an average of 20% since the last update, with some treatment costs going up as much as 35%. The City may begin to fall behind with a comparable increase in funding.

None of the scenarios explored are projected to decrease the total backlog of work. the \$3 million scenario (\$2.7 million capital plus \$300 thousand in maintenance) would allow a small increase in backlog, growing below the rate of inflation.

---

# 7

## Summary

---

The City of Portsmouth has a pavement management system based on road condition data partially updated in 2024. The Portsmouth pavement management system gives City decision-makers a picture of existing roadway infrastructure conditions and a dollar estimate to improve streets in poor condition while protecting those pavements currently in good condition.

The Pavement Management System being implemented by the City is a planning tool, with primary functions of determining the funding levels required to achieve City-wide condition goals and to identify candidate road projects to achieve those goals. Any project list generated by the system needs to be reviewed by the Engineering Department staff and adjusted based on numerous factors, including coordination with utility work, and geographic considerations.

The following bullets provide a quick summary of the status of Portsmouth's pavement management system.

- The City currently maintains **104.3 miles** of roadway.
- The current **average PCI is 82**, up one point from last year.
- The Backlog of Work, meaning the cost to address all roads today that would benefit from maintenance or rehabilitation, is approximately **\$19 Million**, an increase of just under 1 Million from last year, due to increased construction costs.

- The Pease area has 13.1 miles of roadway, and an average PCI of 84.
- Based on pavement management software generated projections, the current \$2 Million per year budget may allow a slow decline in overall conditions, though the network seems to have been performing better than predicted. A budget of \$3 Million per year including \$300 thousand of maintenance work would maintain the road network.
- It is recommended that the City:
  - Continue to update the pavement management system regularly so that budgetary and project planning decisions are made on current data.
  - Do not neglect maintenance on roads in good/fair condition or roads paved 5-10 years ago, so their high PCI can be extended cost-effectively.
  - Address local base problems before overlaying roads.
  - Perform project level testing prior to rehabilitation projects to determine if in-place and new materials will be suitable to ensure proper life of new pavement.
  - Explore expanding its pavement preservation program through the use of surface treatments.
  - Increase funding to match the inflation of construction costs.
